

[School management system software](#) has been developed so as to help improve on the efficiency and speed in the undertakings of normal school environment .this software once in use enables the school management to access all the necessary files and documents of different departments in the school. All the essential documents are to be stored in the system and all transactions are to be undertaken by the system hence making the school offices paperless offices. Implementation of this software will not only speed up activities in the school environment but also make the management of the school save time to attend to other matters. Another important feature of this software is that it allows the management of the school to view various reports of various departments of the school.

[This software also includes a module that handles the office accounts and gives various reports on the same the modern school now is being run by improved technology which enables activities in the school to be faster, more accurate, more efficient and more reliable.](#)

The school management software is integrated into different modules where by different departments are incorporated in the central system for instance the various departments in the school environment can be accessed through the central system by the administrator or the management of the school but the departments can only access the information that is only related to it and not other departments.

[The system is designed to have maximum security whereby nobody can hack or tamper with it. This is achieved through the use of passwords and firewalls that are incorporated in the system to achieve maximum security. The system will allow the whole school fraternity to interact with it in that the students will have all their information stored in it, the teachers will also have all their relevant information stored in it, the subordinates will also have all their relevant information stored in it.](#)

The system has a module that can be put online for the parents and the public or other concern parties to view important information on the following areas:

- [1. Student performance in school and generation of transcripts/report form.](#)
- [2. Student school fees information and generation of school fees statements.](#)
- [3. Student subject selection for the K.C.S.E examinations.](#)
- [4. Student personal information](#)
- [5. Student general progress in school.](#)
- [6. Students or parents can post inquiries on this particular module](#)

This information is accessed by the use of a username and password that is held by the student and the parent other relevant parties like the school management which has all the rights to access all information concerning the student. This will help in reducing the number of parents coming to the school. School can correspond with parents through this particular module and send reminders, newsletters, fee statements and any other information that it want to reach the parents. This basic advantage of this module is that the parent can access all information relating to his student from his office desk just by the click of a button.

All the system computers will be networked to a central server where all information is stored and updated form time to time the central sever can only be accessed by the administrator and the

management this is for security purposes. All other departments will use there own designated passwords to access information that is relevant to them.

The school management reserves all the rights to access of the system. No other unauthorized person can access the system.

The system is designed to monitor all the various departments of the school and their performances, expenses, revenues, losses and profits where applicable. All the departments will be interlinked in the system to form the central system which is administered by the school management.
